

# Antibiotic Resistance Surveillance

## at [HOSPITAL NAME]

“ACORN-lite Clinical AMR Surveillance”

### What is Antibiotic Resistance?

Infections caused by antibiotic resistance microorganisms may not respond to the standard antibiotic treatment and may result in worse outcomes for patients, hospitals and healthcare systems

### What is ACORN-lite surveillance?

We are collecting information about patients who have a confirmed bacterial bloodstream infection

We will ask you some questions about recent hospitalisations and will collect information about your diagnosis and treatment from your medical record

This information will be used to better understand the antibiotic resistance problem and to improve infection treatment guidelines

The study team will ensure that your surveillance data are kept confidential

### What if I DO NOT want to be included in surveillance?

You can choose not to be included in ACORN-lite surveillance at any time, without giving a reason

If you would prefer not to be included, please inform your nurse or doctor or tell the ACORN-lite surveillance team when they visit you

Your treatment will not be affected if you decide not to be included

Please see the ACORN-lite information sheet for further information
